

Module 4: Client-Side Application Development

This module introduces browser-based application patterns.

Students will build a lab activity using AngularJS and Bootstrap 3.

The activity asks students to compare the interface with React and Vue examples.

Faculty review suggested: confirm whether the chosen examples still support the target competencies.

Module 7: Backend and Deployment Practices

Students will configure PHP 5 examples that connect to MySQL.

For deployment, learners will package the service with Docker.

A learning activity asks students to document version control with SVN and Git.

Faculty validation is required before any curriculum decision is made.
